In reference to Registrar circular (Ref: KLEF/RO/CE/2022-23) on dated July 26, 2023; webinar conducted on 29/July/2023 at 11:10 am on “Flood Modelling”. The speaker from industry Mr. Rajesh Kumar Mahana talks about flood modelling. He presented the factors responsible for flood and how those factors can be modelled through the software like HECRAS, HECHMS, and MIKE-FLOOD. He discussed about hydrologic modelling, hydraulic modelling and integrated approach of flood modelling. The students from 2<sup>nd</sup>, 3<sup>rd</sup>, and 4<sup>th</sup> year of civil engineering participated in this webinar.

The screenshot shows a Zoom meeting interface. The main content area displays a slide titled "Introduction" with the following text:

- Flood is an overflow of water that submerges land that is usually dry.
- Floods are among the most common and destructive natural disasters in the world, causing significant damage to infrastructure, property, and lives. Flood modelling plays a vital role in helping us better prepare for and mitigate the impacts of these devastating events.

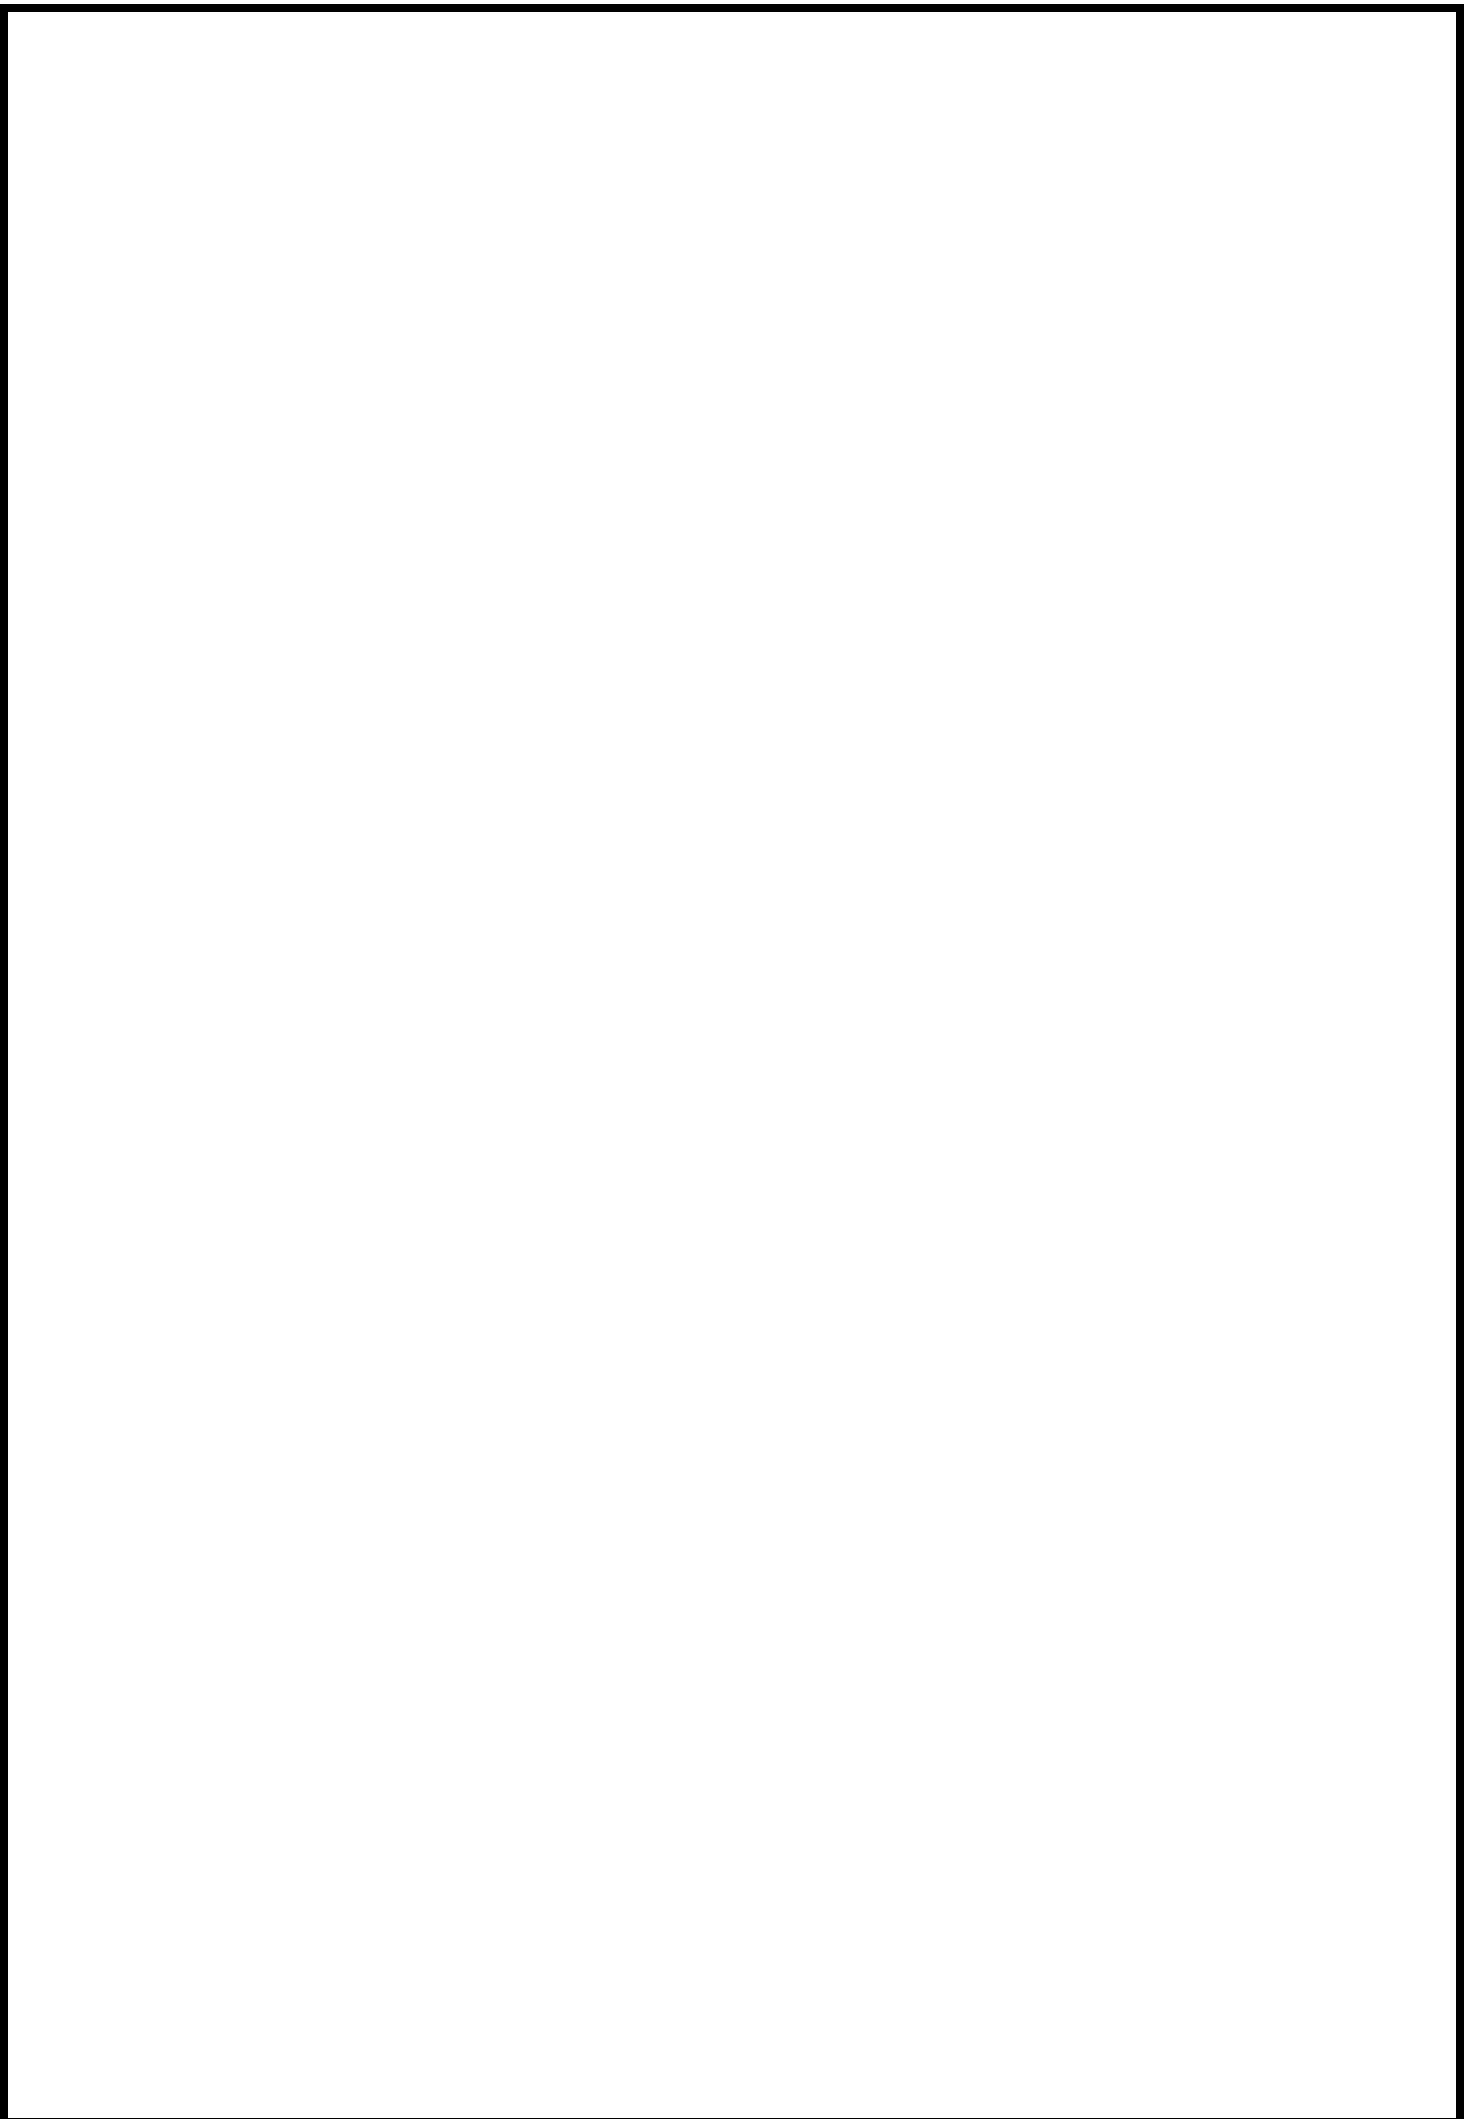

The slide also features an aerial photograph of a flooded residential area. The right-hand side of the screen shows a "Participants (38)" list, including the host Umesh K. Singh and presenter Rajesh Kumar Mahana. Meeting controls like "Unmute", "Start video", "Share", and "Record" are visible at the bottom.

The screenshot shows a Zoom meeting interface. The main content area displays a slide titled "Approach to Flood Modelling:" with three categories:

- Hydrological Models:** These models focus on predicting river flows and water levels based on rainfall patterns, soil conditions, and basin characteristics.
- Hydraulic Models:** Hydraulic models simulate the behavior of water movement, including flow velocity, depth, and inundation mapping, in river channels and floodplains.
- Integrated Models:** These models combine hydrological and hydraulic components to provide a comprehensive understanding of flood behavior, encompassing both river and coastal flood scenarios.

To the right of the text is a flowchart titled "FLOOD MODELING". It shows a process starting with "OBSERVED PRECIPITATION" and "FORECASTED PRECIPITATION" feeding into a "HYDROLOGIC MODEL". This leads to "CALIBRATION/VALIDATION" and "DISCHARGE". The "DISCHARGE" then feeds into a "HYDRAULIC MODEL", which also undergoes "CALIBRATION/VALIDATION". This produces "ESTIMATED FLOOD EXTENT" and "OBSERVED FLOOD DEPTH". The final "RESULT" stage outputs "FLOOD DEPTH", "FLOOD EXTENT", and "FLOOD DISCHARGE".

The right-hand side of the screen shows a "Participants (50)" list. Meeting controls are visible at the bottom.
